

EGR Valve Cleaning Kit

The EGR (Exhaust Gas Recirculation) Valve is an emission control device that is placed on the exhaust collector and controls the burned gases that return to the inlet collector. The purpose of the EGR valve is to lower the NOx.

The problem

When the EGR Valve, due to the deposits of soot and sludge, cannot breathe normally, serious problems can arise. Think of:

- Decreased engine performance,
- Poor idle speed,
- Higher fuel consumption,
- Acceleration loss
- Increase in harmful exhaust gases (NOx),

Possibly the engine can even go into emergency running with replacement of expensive parts as a result.

Advantages

- Removes: soot, eraser and other precipitations
- Bardahl is the only one to supply a complete kit that cleans EGR-Valve (and possibly gas valves) intake process.
- Restores air circulation in the combustion chamber,
- Reduces fuel consumption
- Prevents expensive repairs / replacements of parts
- Easy to use
- Suitable for particulate filters and catalysts

Manual

After this treatment it is recommended to every 5000km Bardahl Common Rail Diesel Injector Cleaner (1155B) add to the fuel for long-term protection.

NA

An EGR valve with mechanical failure cannot be repaired even with this cleaning kit. Then replacing is the only solution.

Article number 9123

Content 1 aerosol 400ml and 1 vial additive 300ml

Information regarding detergents can be found on the SDS of this product
