

## Fuel Stabilizer

When the oldtimer is not used in winter, it is advisable to fill the tank. This prevents condensation in the fuel tank. However, several measures are needed when the car/boat/outboard engine is 'stored' for a long time. Bardahl has therefore developed **Fuel Stabilizer**.

### Properties

---

- Reduces evaporation, extending the storage time of petrol by 24 months
- sealing the fuel filter is avoided
- oxidation of the fuel tank is prevented
- valves and seats are lubricated
- the quality of petrol does not reduce
- the carburetor is cleaned
- cleans the fuel lines
- suitable for fuel 250 liter

### Manual

---

Pour Fuel Stabilizer into your fuel tank before refueling. This way the fuel (tank) of the oldtimer is protected for a long time. Drives at least 20 kilometers (12 miles) after adding fuel stabilizer to your fuel tank, so that this additive also ends up in the carburetor and fuel lines and can do its job properly. Suitable for all types of petrol and all types 2 and 4-stroke engines, except engines equipped with an exhaust catalytic converter.

**Article number** 4874B  
**Capacity** 250 ml
